

# Guide for DrDelay's GambleBot

By Silence/unforgivn

Example to see how the Bot operates: <https://youtu.be/rImODJMgq80>

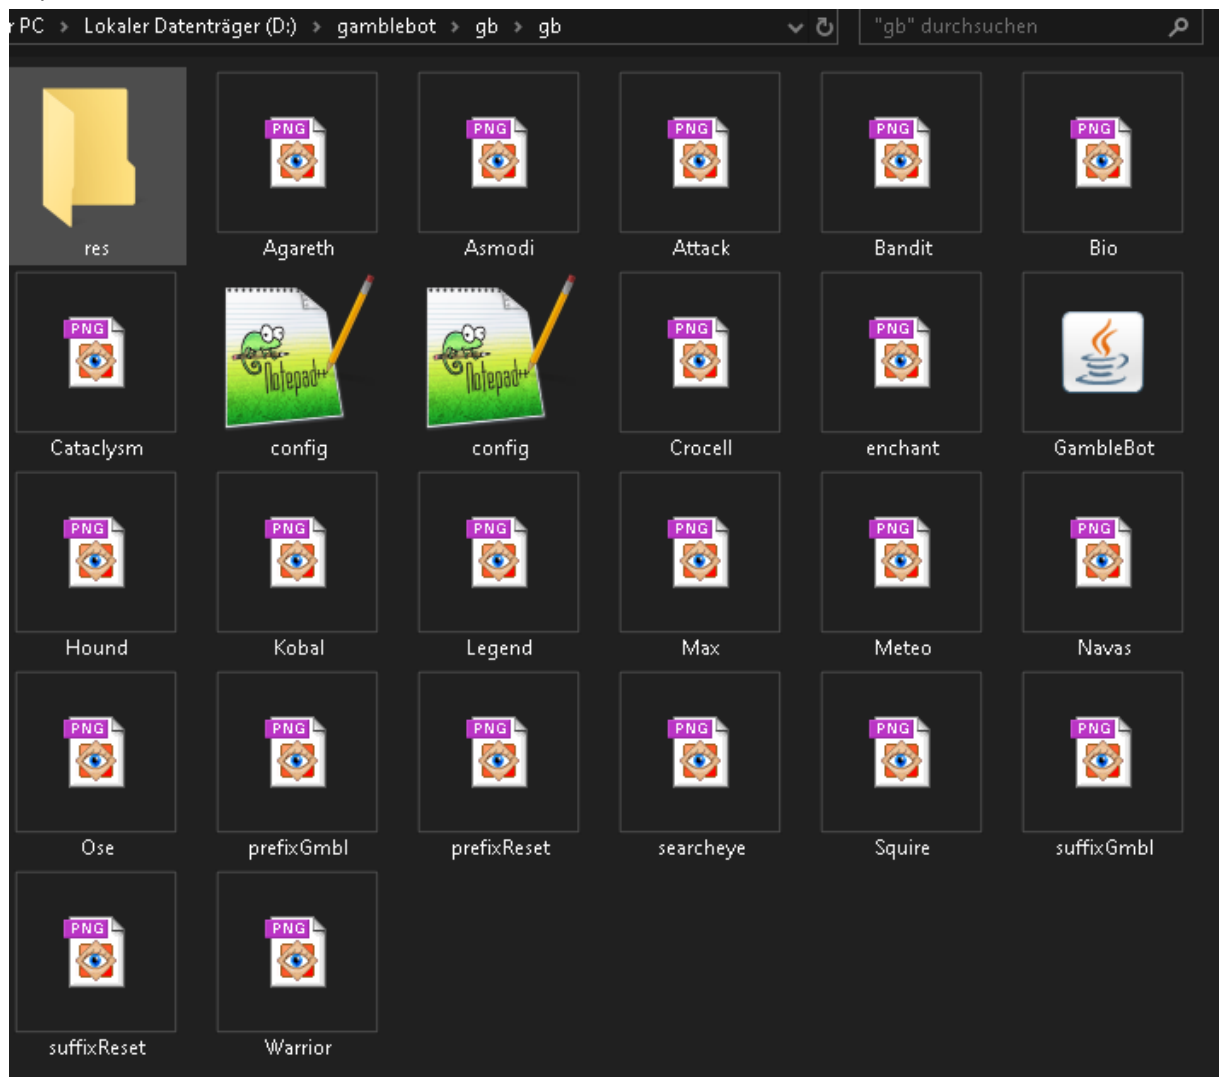

## Requirements:

-7zip // <https://7-zip.de/download.html>

-Java // <https://www.java.com/de/download/>

- notepad++ // <https://notepad-plus-plus.org/downloads/>

1. Download: <http://www.mediafire.com/file/1zucbeykqbx0mmw/gb/file> or from DrDelay
2. Unpack it

- Depending on the version you have, the name of the GambleBot can differ. It may look like this:

If you want to have an easier time, just rename it to “GambleBot”. Otherwise you have to adjust the “java -jar GambleBot.jar” command.

- Open config.txt -> Enter your preferred fixes.png, keep the “-” inbetween Prefix and Suffix, Top is Prefix (-> Bandit.png), Bottom is Suffix. Ctrl+S

```
1 Bio.png
2 Legend.png
3 Max.png
4 Squire.png
5 Meteo.png
6 Bandit.png
7 Cataclysm.png
8 -
9 Bio.png
10 Legend.png
11 Max.png
12 Meteo.png
13 Cataclysm.png
```

- The endgame fixes are already saved as .png, if you just want to gamble one fix because you have the gamble for it in storage or just want to test you can use Cataclysm.png for the initial try.
- Even if you just want to gamble Prefix, you have to have Suffix gambles and removals in your inventory.

## 7. Ingame Requirements:

### 1. Gambles, be it Weapon or Armor and ofc. Removals

### 2. Search Eye

### 3. And the item you want to gamble

Example is made with Thunder Storm (Standard Weapon)

- Start the game in window mode, I suggest in borderless or 1920x1080.

9. Go to the Lab with your desired item and scroll the inventory completely down!

10. Now drag your Search Eye to the **highest/first** spot that's visible  
(Inventory is still scrolled down completely!)

11. Make sure that your Item is at least E1!

12. Open your config.properties, only change lastItemPos.

```
1 lastItemPos=27
2 factordelay=350
3 showdelay=0
```

13. Locate your item! In this example the Thunderstorm is located at the 57<sup>th</sup> position. Search Eye takes the first slot. One row has enough space for up to 10 items.

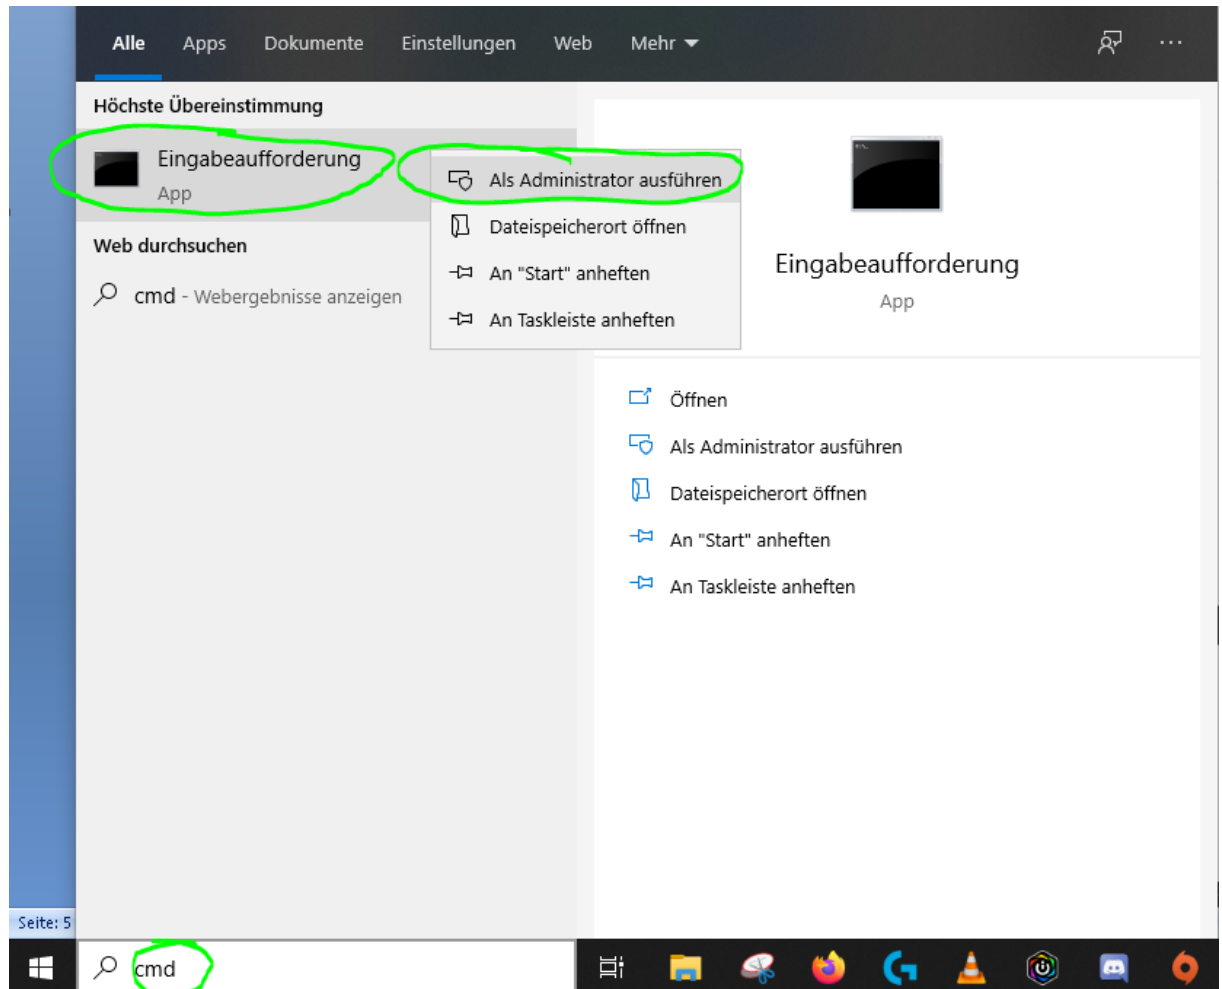

14. Now replace lastItemPos=27 -> lastItemPos=57 and save. (Ctrl+S)

```
1 lastItemPos=57
2 factordelay=350
3 showdelay=0
```

15. At this point you should have selected your desired fixes and located your item.

16. Open CMD as admin

17. Now you have to change CMD to use the proper drive/directory.

18. Open the folder where you saved the unpacked gamblebot.

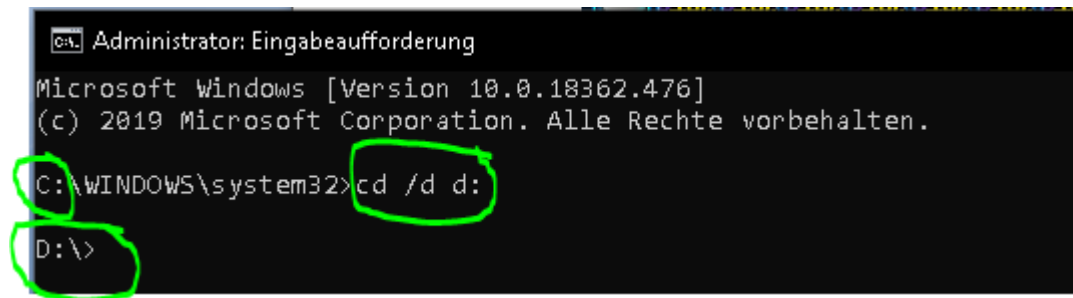

19. In my case it's located on D: , not on C: .

20. Default CMD should look like this:

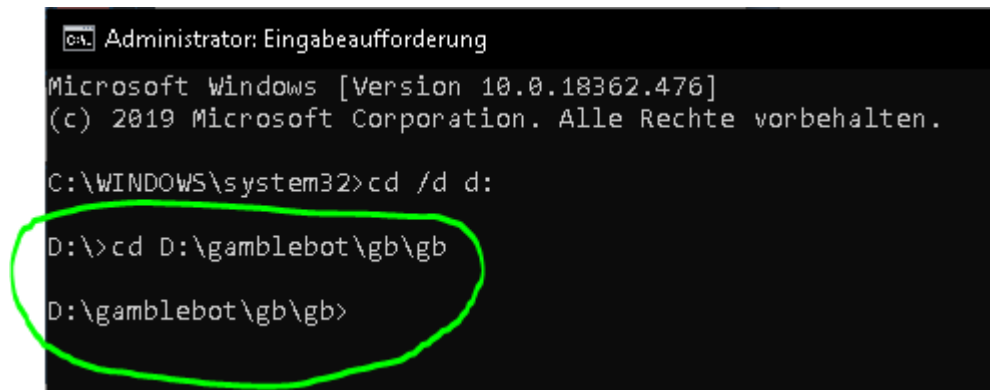

21. First I changed the general directory to D: .

c&p: cd /d d:

```
Administrator: Eingabeaufforderung
Microsoft Windows [Version 10.0.18362.476]
(c) 2019 Microsoft Corporation. Alle Rechte vorbehalten.
C:\WINDOWS\system32>cd /d d:
D:\>
```

22. Now You have to go to the exact directory: c&p: cd D:\gamblebot\gb\gb

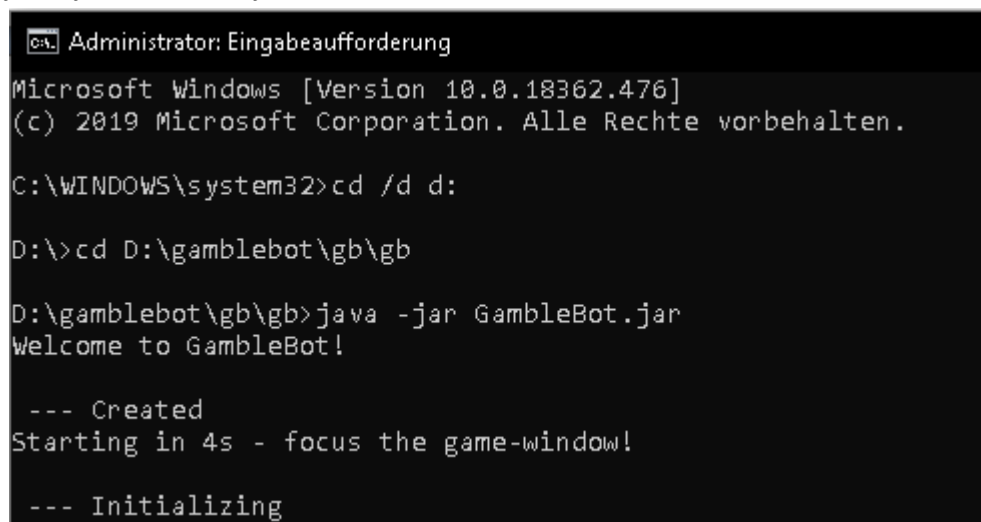

```
Administrator: Eingabeaufforderung
Microsoft Windows [Version 10.0.18362.476]
(c) 2019 Microsoft Corporation. Alle Rechte vorbehalten.
C:\WINDOWS\system32>cd /d d:
D:\>cd D:\gamblebot\gb\gb
D:\gamblebot\gb\gb>
```

23. We did this so if you have to cancel the bot at any given time (press ESC, Escape) you just have to re-enter the following command to start the bot again.

24. At this point everything is ready and you can start the GambleBot with the command:

java -jar GambleBot.jar

```
Administrator: Eingabeaufforderung
Microsoft Windows [Version 10.0.18362.476]
(c) 2019 Microsoft Corporation. Alle Rechte vorbehalten.
C:\WINDOWS\system32>cd /d d:
D:\>cd D:\gamblebot\gb\gb
D:\gamblebot\gb\gb>java -jar GambleBot.jar
Welcome to GambleBot!

--- Created
Starting in 4s - focus the game-window!

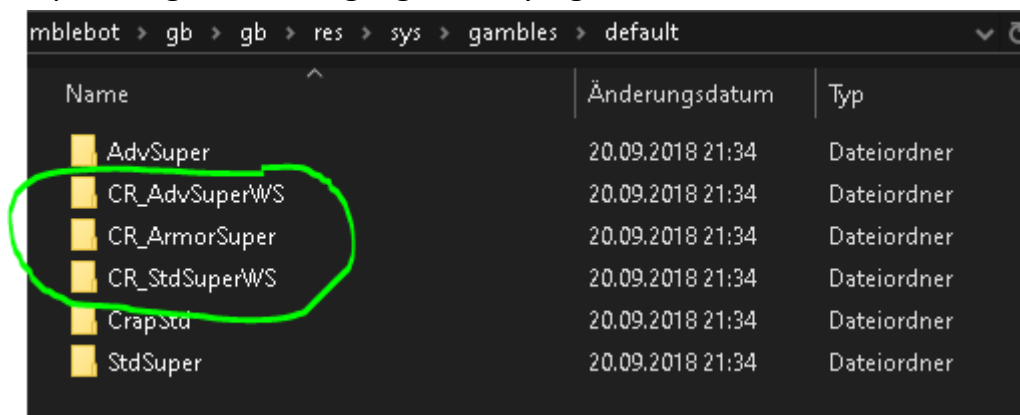

--- Initializing
```

25. Tab into the game and let the Bot do the job. (You should be in the Lab already, if you aren't you have 4 seconds to get there.)

### Extra information:

-if you want to gamble Armor/Adv. Weapon make sure to replace the gambles in the main directory.

Step1: D:\gamblebot\gb\gb\res\sys\gambles\default

Step2: Decide what you want to gamble, Armor/Adv/Std

Step3: Open one of the marked folders and replace the .png in the mainfolder (D:\gamblebot\gb\gb)

Step4: make sure to adjust your fixes, ALWAYS! It will gamble to infinity if you fuck up your config.txt!!

You want different fixes than the ones already in the directory? Follow these two steps:

Step1: Have a screenshot with a desired fix or go to the Trade Center and see if there's one. In this example I randomly picked "Double".

**Double**

Now open Paint or any other program you want to do this with.

Turn all the pixels except for the actual “fix-name” black.

Save it as .png, name it accordingly and place it in the proper directory. Good luck.
